

~~1. The first step in the process of the cell cycle is the G1 phase, which is the period of cell growth and preparation for division. During this phase, the cell increases in size, synthesizes proteins, and replicates its DNA. The G1 phase is the longest phase of the cell cycle and is followed by the S phase, where DNA replication occurs. The S phase is followed by the G2 phase, where the cell continues to grow and prepares for division. The G2 phase is followed by the M phase, where the cell undergoes mitosis and cytokinesis to produce two daughter cells. The M phase is the shortest phase of the cell cycle and is followed by the G1 phase, completing the cycle.~~
